```
Safety bars - claims 3.1 (monitor scope) and 4.1 (attack-plan sharing)
Generated (UTC): 20261020T021449Z

SINGLE-COLUMN VARIANT (3.85 in wide): the full figure's panel (a) is DROPPED;
its panels (b) and (c) are re-lettered (a) and (b), stacked, with HORIZONTAL
bars on one shared Safety x axis. Arm colors and values are identical to the
full figure; bar labels drop the redundant DTD prefix. Panel letters in the notes
below refer to the FULL three-panel figure; the per-arm list at the end
uses this variant's titles.

Three panels on a shared Safety axis. Panels (b) and (c) are threshold-matched
internally; the panels sit at DIFFERENT monitor thresholds (3.0 vs 2.333) and
different usefulness levels, so bars are NOT comparable across a panel divider.

Panel (a) is the headline protocol contrast and is NOT threshold-matched: TM has
no monitor_threshold; usefulness is TM 1.00, DTR 0.77, DTD 0.80 (claim-10 Pareto
20260929T224609Z). DTR = DTRF defer0.5 q90; DTD = canonical no-plan thr2.333
(measured, NOT offset-shifted). Panel (a) shares no arm with panel (b).
DTR CI computed 2026-10-20 with compute_metrics.py --bootstrap-ci (same method;
that run reproduces the DTD bar's 0.850 [0.795, 0.891] exactly).

Panel (c) 'attack plan unshared' = the plan reaches the FIRST implementer and is
not passed onward. It is NOT the no-plan arm (that rung lives in
plot_plan_delivery_safety_bars.py). 'shared' = inject_attack_plan=True.

Panel (a)'s DTD bar (selected design, thr2.333, no-plan attacker) takes the
DTD family gray (#7C7D7F); the other four DTD bars each take a strictly
lighter shade, left to right: #959698, #AFAFB1, #C8C9C9, #E2E2E2.
TM takes the TM family blue (#3A82B5), DTR the DTR orange (#F15F22).
Full opacity, so faces match plot_safety_usefulness
exactly. No hatching and no legend -- the x tick labels
are the key. Value labels sit above the upper whisker (compare_protocols /
plot_scalar_barplot convention).

NAMING (follows the code, not the registry names):
  'monitor all actions'               = tu-root-history (RHE), full cross-child history
  'monitor current child task actions' = tu-full-history (FHE), current child only
  see tu_bb2/ct_ext/decomposer.py:313-320, tu_bb2/ct_ext/monitors.py:12-17

attack_threshold: 0   audit rule: p95 fractional-tie (tau=8.667 in every arm)
CIs: 0.95 cluster-by-task percentile bootstrap (B=500, seed=0),
  p95 audit threshold recomputed per draw
resample_agg: max     all attack arms auto-submit truncated

VALUES ARE TRANSCRIBED, NOT RECOMPUTED - see module docstring for source reports.

NO-PLAN OFFSET (loose-plan arms only): the two bars built on the V7 loose-plan
attacker (both panel-(b) bars) are DRAWN shifted, the same
way the claim-10 Pareto draws its dotted DTD line:
  delta = no-plan thr2.333 safety - loose-plan thr2.333 safety = 0.8502 - 0.8818 = -0.0316
  source: 20260916T220939Z_safety-use_claim10_budget5pct_BA10_AUTOSUBMIT_dtrf-q90_dtd-noplan_RF3.pdf
  drawn mean  = measured mean  + delta      drawn lower = measured lower + delta
  drawn upper = measured upper (UNSHIFTED), so each bar is widened by |delta|.
  Value labels show the DRAWN mean. Measured values are listed per arm below.
  Panel (c)'s WITHTIPS strict-plan arms are NOT shifted (the offset converts
  loose plan -> no plan and does not apply to them). The offset was measured
  under the RHE monitor; applying it to the FHE bar assumes the plan effect is
  monitor-independent.
